

Exercise 5.4.3

The discharge of a river at an upstream measuring station A equals $100 \text{ m}^3 \text{ s}^{-1}$.

The discharge at a downstream measuring station B equals $120 \text{ m}^3 \text{ s}^{-1}$.

In one hour, the storage in the river between these two stations reduces by 45000 m^3 .

The discharge at the upstream station A after one hour is $110 \text{ m}^3 \text{ s}^{-1}$.

Assuming a linear change of the discharge with time, determine the discharge in $\text{m}^3 \text{ s}^{-1}$ at the downstream station B after one hour.

Surface water hydraulics

Answer 5.4.3

Set up a water balance for the river in-between A and B

for the time interval $\Delta t = 1$ hour: $\bar{Q}_{IN} = \bar{Q}_{OUT} + \frac{\Delta S}{\Delta t}$

Q_A at start = $100 \text{ m}^3 \text{ s}^{-1}$; Q_A after one hour = $110 \text{ m}^3 \text{ s}^{-1}$

Average Q_{IN} during $\Delta t = 1$ hour equals $105 \text{ m}^3 \text{ s}^{-1}$

Q_B at start = $120 \text{ m}^3 \text{ s}^{-1}$; Q_B after one hour = $Q_B \text{ m}^3 \text{ s}^{-1}$

Average Q_{OUT} during $\Delta t = 1$ hour equals $(120 + Q_B) / 2 \text{ m}^3 \text{ s}^{-1} = 60 + \frac{1}{2} Q_B \text{ m}^3 \text{ s}^{-1}$

Change in storage $\Delta S / \Delta t = -45000 \text{ m}^3 / 3600 \text{ s} = -12.5 \text{ m}^3 \text{ s}^{-1}$

$$105 = 60 + \frac{1}{2} Q_B - 12.5 \quad \frac{1}{2} Q_B = 57.5 \text{ m}^3 \text{ s}^{-1}$$

Answer: $Q_B = 115 \text{ m}^3 \text{ s}^{-1}$
