

Historic coastal change

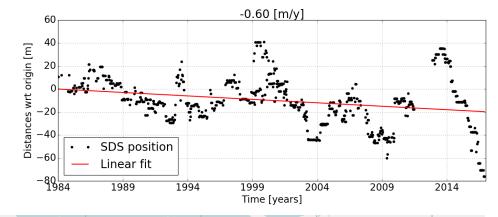

- > 2 million satellite images analysed
- > 24% of the sandy beaches are eroding > 0.5 m/yr

Driving factors of coastal change

- > Signal decomposition to look for drivers & response
 - ➤ ML: driver of change per hotspot (Kras, 2020)
- ➤ Key for ecosystem-based adaptation learn from the pa

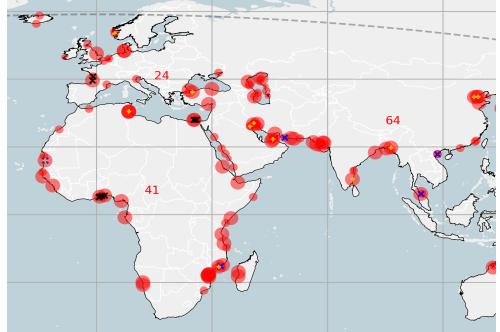

Human drivers of shoreline evolution	Prograding (+) and / or retreat- ing (-)	Influence
1. Nourishments	+	direct
2. Land Reclamations	+	direct
3. Port / Breakwaters	+ and -	indirect
4. River Sediment Supply	-	indirect

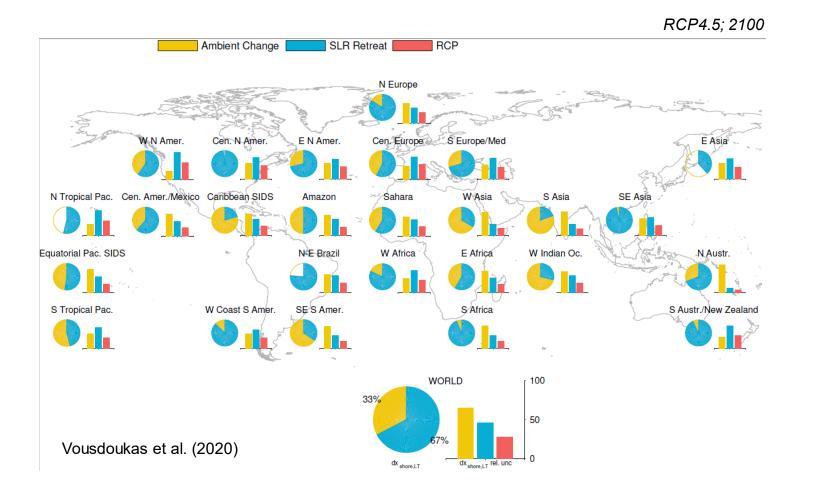

Table 2.2: A summary of the effects and characteristics of the natural drivers of she in the introduction of this section.

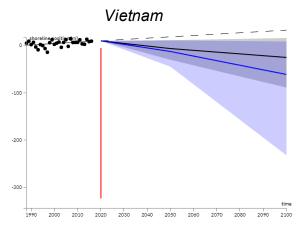

Natural drivers of shoreline evolution	Prograding (+) and / or retreat-	Influence
	ing (-)	
1. Beach Sediment Supply	+ and -	X
2. Sand Bar Migration	+ and -	X
3. Tidal Inlets	-	X
4. Storms	-	X

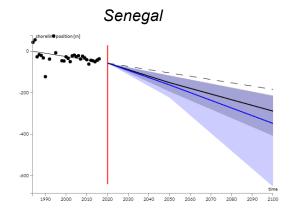

Future coastal projections

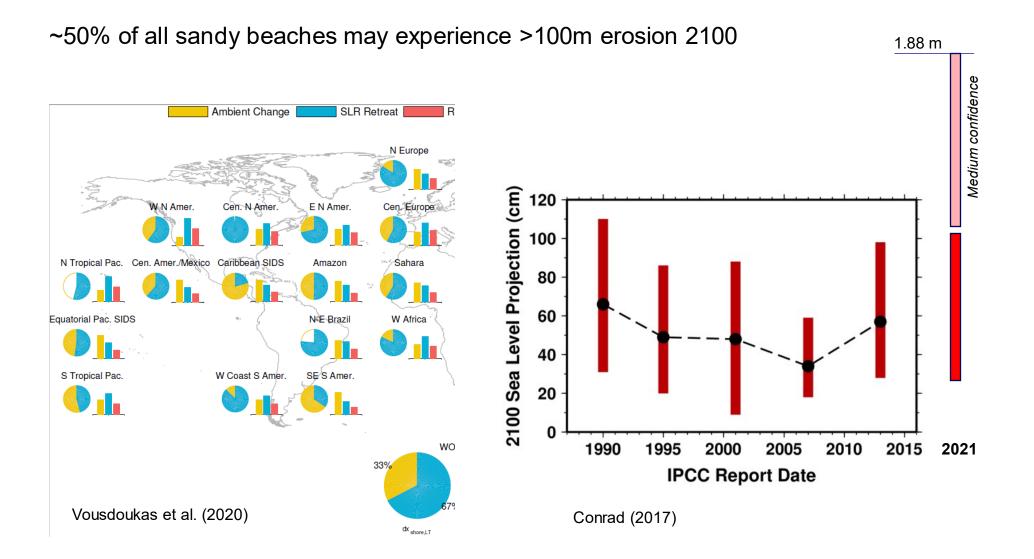

~50% of all sandy beaches may experience >100m erosion 2100

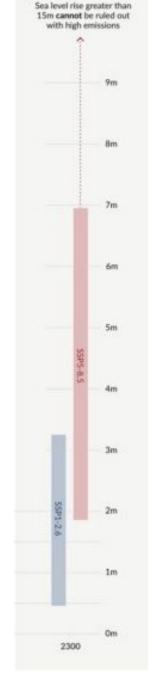

Future coastal projections

e) Global mean sea level change in 2300 relative to 1900

Another threat to our beaches...

- Annual sand consumption: 50 billion tons of sand
- 27x27 m wall around the globe every year!

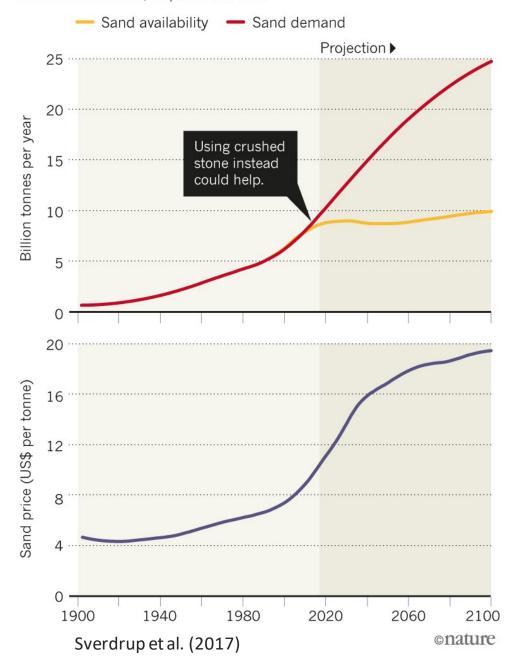

You can only spend your cent once!

Deltares

GLOBAL SCARCITY

Demand for sand and gravel for construction is rising faster than natural sources can sustain, so prices will soar.

My view on:

Potential of ecosystem-based adaptation at large scale:

- Awareness (what is my problem and when will it hit me?)
 Knowledge comes with responsibility!
- Understand your system!
- Portfolio of adaptation solutions to inspire
- Mapping suitable solutions

Relevant knowledge gaps for upscaling

- How to move From pilot to Mainstreaming
- Behavior of adaptation solutions over time
- Lack of appropriate design tools to forecast dynamics of solution and uncertainties

What are the first steps?

- Develop a full virtual pilot!
- Develop a Global Coastal Atlas
